

The Orwell City site, which was the first to denounce the presence of graphene oxide in injections, masks and tests thanks to its translations into English of the La Quinta Columna site, has just published a summary of the murder weapon extracted from a video on Rumble (subtitled in English).

It is clear that **graphene oxide poisoning gives all the symptoms attributed** to "covid-19" and those attributed to the various side effects of the injections.

Moreover, he makes the link with 5G which activates the effects of the poison and speaks of its "antidotes": basically **powerful anti-oxidants (glutathione) to which I would add vitamin C and magnesium**, which acts indirectly as an oxidant, participating, among others, in the synthesis of glutathione. Cruciferous vegetables (cabbage family) also contain many antioxidants.

Reminder of a site that talks about glutathione and quotes some brands (be careful **and only buy the reduced form!**): <https://doctonat.com/glutathion-notre-dossier-complet/>

Finally, it is possible to contact La Quinta Columna, because they understand French. Email address at the end of the article.

Here is the translation of the transcript of the video. Once again, I ask you to spread the word about this crucial information that reveals the pot-aux-roses.

Learn how La Quinta Columna discovered the connection between graphene oxide and electromagnetic fields.

Many people already know about the work done by the Spanish research team.

They are the ones who had the courage to get a vaccine ampoule and send it for analysis to a renowned Spanish university thanks to Prof. Pablo Campra Madrid who is compiling and formalizing the results in a report that promises to be more decisive than the preliminary report prepared for the public early last week.

However, there are people who do not know La Quinta Columna. If you are one of them, then the following video is for you. Orwell City has translated, transcribed, subtitled and edited the video to spread its message around the world.

Ricardo Delgado, founder and director of La Quinta Columna, along with Dr. Jose Luis Sevillano, participated in the 28th Humanitarian Conference organized by the Global Coalition for Health and Life.

"La Quinta Columna wants to make clear from the beginning that we have the obligation to be united because we are in the same battle to give the best of ourselves and the stake is the future of all species. On the strength and speed dedicated to this task will depend the future of all humanity. We are now at the precise moment when things can start to change and in this sense La Quinta Columna will summarize the results of its research over the last year and a half, but especially over the last two months. And why the last two months? I still remember the words of Dr. Jose Luis Sevillano, we work in pairs, who accompanies me in this research. He said at the start of the vaccination that we would really see what it would do and what material might be there.

Then we realized that there was a new phenomenon that we tried for a while to deny, although it is now obvious because of the millions of videos on social networks and we could measure it with instruments: telemeters, magnetometers, etc. I want to talk about the magnetic or pseudo-magnetic phenomenon that people acquire after inoculation. A magnetic phenomenon on the one hand, but which transforms the **injected people into superconductors and which also stores energy that can be measured with a multimeter in certain places, like the forehead, for example.**

From there, we started looking for what kind of material or, better said, nanomaterial can cause this kind of property inside the body and we found a few candidates. One of them was initially graphene. **Graphene acquires magnetic properties inside the body and it is a superconductor.** It is used to store and condense energy and it

was a very plausible candidate. Without having any knowledge of what was in the light bulb, we realized that the graphene industry, or rather the market for the graphene industry, saw a surge at exactly the same time as the immunization campaign started in late December and early January. But also, curiously, during the flu vaccination campaign. When we saw the possibilities that graphene has, or rather, the possibilities that graphene oxide nanoparticles have in the body in terms of neuromodulation and increasing neuronal electrophysiological effects for brain mapping, we realized the possibility of graphene injection. Can graphene be injected? Yes. And in fact, some scientific papers have already raised the possibility that it could be used as a nano-adjuvant in vaccines. Based on these suspicions, we did what anyone would do and recommend you do if you have access to a vaccine ampoule.

We had access to an unopened Pfizer ampoule sent to the university on my behalf for analysis and research of the material in question, graphene. Some time later, thanks to Dr. Pablo Campra Madrid, Doctor of Chemistry, Biology and member of the University of Almeria, we obtained this preliminary report which mentioned a solid proof of the presence of graphene in the sample and the fact that it was also the main component of what they wrongly call "vaccine".

This strong evidence was then complemented by other techniques, such as spectroscopy, electron microscopy, electromagnetic frequency techniques, optical microscopy and ultraviolet spectroscopy, which coincides with the peak wavelength of graphene oxide. We then studied the toxicity or cytotoxicity of graphene in the body.

Pay attention to this finding: in the body, graphene oxide causes thrombosis, clots. It causes post-inflammatory syndrome or systemic or multi-organ inflammation. When graphene oxide exceeds the levels of glutathione - the body's natural antioxidant reserve - it causes alterations in the immune system, its collapse and a storm of cytokines. When inhaled, it spreads evenly throughout the alveolar tract [pulmonary alveoli] and causes bilateral pneumonia. Inhaled, it also causes inflammation of the mucous membranes and thus loss of taste and smell: anosmia.

In short, graphene oxide behaves exactly like the supposed Sars-Cov2 of the official version, generating the exact symptomatology of a severe covid-19. When it is installed at the level of neurons it causes neurodegeneration or in other words a neurological covid-19.

So from there, we started to see what compounds, drugs and treatments were possible to degrade graphene oxide. And look what we found: an administration of N-acetylcysteine or glutathione, degrades it. Because it counteracts free radicals and oxidants, all the toxins that can enter the body.

And we found out that there were about 300 clinical studies on the use by some hospitals and universities of N-acetylcysteine with incredible results. For example, 100 patients with saturation levels below 50%, almost dead - to put it bluntly - with bilateral pneumonias, were saved one hour after intravenous glutathione or N-acetylcysteine administration. They were taken off life support.

We now really understand why these treatments worked: because they addressed all the symptoms of the disease that was supposed to be caused by sars-cov2. Since there is no scientific evidence to date of actual sequencing and isolation of sars-cov2, we suspect with a host of credible clues that covid-19 disease is in fact the side effect of introducing graphene oxide into the body by various means.

And I say 'different ways' because, despite their withdrawal at the time, masks containing graphene oxide nanoparticles were put into use and are still being marketed. So, through companies like Nanografi, we have masks with graphene oxide, but also nanoparticles introduced in PCR tests; graphene oxide is also present in antigenic tests; hydrogel also contains it, as well as intranasal vaccine, because in aerosol form, graphene oxide is more powerful. The intranasal vaccine is also prepared by Turkey, for example. It is manufactured by Nanografi against covid-19 and influenza.

We know that graphene oxide is naturally eliminated by the body's glutathione levels and that is why we suspect that a second, third and even fourth dose is needed as often: in order to get your considerable dose of graphene oxide. In short, we are talking about a simultaneous and gradual mass poisoning of the world population.

Think that if the preliminary report of a professor of the public university of Almeria - and I know that a similar study is being done in other European and Latin American universities - if it is determined that there is graphene oxide in the ampoules, how is it possible to inject graphene oxide if the masks have been taken out of circulation because they cause lung disease due to nanoparticles? We are talking about a crime against humanity with the complicity of governments or at least with their participation.

When we studied glutathione, we realized that its level decreases from the age of 30, but above all, it drops considerably from the age of 65. In fact, covid-19 weighs heavily on older people in terms of mortality, apart from those with low immunity and other pathologies. We also realize that children have high glutathione stores because of their youth and covid-19 disease has no impact on children. Glutathione is particularly low in the obese population, one of the most affected by covid-19. We realize that glutathione is related to vitamin D levels and patients with the disease have low vitamin D levels. We realize that athletes have high levels of endogenous glutathione, which is secreted by intense exercise and athletes are hardly affected by covid-19.

Everything we have studied subsequently only increases and corroborates the hypothesis that the supposed Sars-Cov2 of the official version is precisely graphene oxide. And that all the elements of protection or supposed protection, that we were given: masks, PCR tests, swabs, antigenic tests and vaccines - falsely called vaccines - are precisely all the elements that will make the disease develop later.

Why do I say 'later'? When we studied the electromagnetic phenomenon, we understood that graphene oxide has what is called an 'electronic absorption band'. The electronic excitation, its magnetic resonance is precisely in the third frequency band of the 5G technology, the one that is being presented right now and that, remember, was with us during the pandemic. When everything really started, we had three 'networks': the first one is the 5G terrestrial antenna that never stopped being installed - because only the antenna operators were working - and that curiously were installed 8 times out of 10 near geriatric centers and retirement homes and EHPADs, in their close vicinity, places where precisely the population is most affected. Another internal 'network': graphene, according to the preliminary report on the light bulb in this university. And an external network, the one used by satellites to supposedly provide 5G coverage.

It's incredible, we are telling a science fiction movie, but believe me, today nanoscience, neuroscience and biotechnology have advanced enormously. We have only made an approximation in the field of science and behind the scenes of civil society. Can a person be controlled or neuro-controlled remotely? Yes, it is possible and it is probably done in a covert way, which may explain some of the abnormal behaviors of the population, especially those who have been inoculated or dosed with graphene oxide through different routes. As I said, I know I'm describing a science fiction movie, but at this point, it can be hard to really believe in anything. In that sense, we're saying that covid-19 is just the collateral effect of the introduction of this nanocompound through different means, and we suspect that it was introduced during the 2019 flu campaign.

As I mentioned, graphene oxide has an absorption band from which it oxidizes much faster when you push the little button that activates 5G coverage or perform a technology test. Do you think it's a coincidence that Wuhan - where the pangolin and bat soup came as distractions - is the first city in the world with a 5G technology trial in late November 2019 and where all the previous flu shots containing probably graphene oxide have started? When excited, graphene oxide multiplies its frequencies. With a minimum signal, it oxidizes much faster and breaks the balance between glutathione levels and toxicity in the body, generating bilateral pneumonia, altering the behavior of the immune system, which cannot cope as soon as neutrophils [a variety of polynuclear white blood cells] try to phagocytose it as if it were a pathogen, as if it were sars-cov2.

We're sharing an article today. Let's see: graphene oxide is detected in the body by specialized cells (neutrophils) of the immune system. Just as if it were a pathogen. It doesn't matter to the body, to the immune system, that it's a biological agent because it has never behaved like a biological agent. There are incubation periods if it is biological. **It is not possible that in residences in our Spain, like Mataroz in Barcelona, half of the residents die in 4 hours.** If it is a biological agent, it does not cause bilateral pneumonia, but rather an asymmetric pneumonia: it usually enters through the right lung because of the symmetry. But half of the residents who had been previously vaccinated against influenza could not die.

We observed that the more flu shots, the higher the covid-19 mortality rate, and logically we saw a relationship there. The other relationship was electromagnetic fields. What we didn't know was that there was a marking on each of these people to make them a target population for electromagnetic focus. A deadly weapon that now makes people magnetic and you would understand logically that if they interact with these sources of radiation at the specific frequency and quality, they trigger oxidation, break the redox balance of the biomarkers in the body, and cause covid-19 disease.

We know this very clearly and we have all the scientific articles that prove it. One of them is this:

(GO = graphene oxide)

"Researchers at the Karolinska Institute, the University of Manchester and Chalmers University of Technology have shown that the human immune system handles graphene oxide in a similar way to pathogens, possibly leading to safer biomedical applications in the future."

What you see here is graphene oxide being attacked by neutrophils, which are, let's say, immune system cells that are trying to phagocytose it, to engulf it: to clot it. That's why graphene oxide generates clots and thrombosis.

"Graphene oxide is currently being investigated for use in delivery methods for various drugs and for other medical and non-medical applications. However, it is critically important to understand how these materials interact with the body. The study shows that neutrophils, the most common type of infection-fighting white blood cells - like a pathogen - release so-called extracellular neutrophil traps when they encounter graphene oxide. These traps are made of a "spider's web" of DNA packed with proteins that help neutrophils destroy microorganisms such as bacteria and fungi.

The researchers found that graphene oxide causes specific changes in the lipid composition of the neutrophil cell membrane, leading to the release of the traps. **They were also able to show that anti-oxidant treatment such as N-acetylcysteine and glutathione - reversed this process.**"

That's why glutathione treatments worked and that's why treatments with **N-acetylcysteine, which is a precursor to glutathione worked as well.** Because they both provide an army of antioxidants to deal with a toxic substance, a poisoning, introduced into the body by different routes.

In a companion study published in Nanoscale, graphene oxide was shown to be degraded in neutrophil traps, much like bacteria and other pathogens. Taken together, these studies show that graphene oxide can be trapped and degraded by neutrophils just like pathogens. I want to tell you that we have published on our website at least 70 studies that reflect everything we say and present here.

On the other hand, I have been asked about the effectiveness of chlorine dioxide. It works in a different way. Its role is to oxygenate the cell, it prepares it so that it is not easily destroyed by this toxic. What glutathione does is provide an army with more soldiers to deal with the toxins. What we have found, as I said, is that most

treatments with **N-acetylcysteine or glutathione** and even with other antioxidants, like **astaxanthin**, which is a powerful antioxidant, have been very patient-friendly treatments.

And also, curiously and quite suspiciously, we have discovered that these health institutions are literally governed by evil; this is psychopathy like never before seen in history. On June 17, the FDA attempted to stop the market for N-acetylcysteine after 57 years of use as a normal and common mucolytic. That was very suspicious, wasn't it?

So that's my presentation basically. No doubt you can look up the studies done at La Quinta Columna. Well, it's just something very conclusive and it's the preliminary report from a renowned professor from a public university here in Spain. We are close to providing additional evidence to give more strength to this report in which we have already been told that there is strong proven evidence of graphene oxide in the sample that we sent.

I have tried here to make the presentation as synthetic as possible so that no doubt can be created by the presentation given here and so that it can be clarified during the time we have left."

Ricardo Delgado.

If you want to support La Quinta Columna, you can refer to their official website and follow them on their official channels.

On Telegram, Instagram, Youtube and Twitch.

If you want to contact them directly, send them a message on tutoronline@hotmail.es. Don't worry about the language barrier, they understand English and French.
